Tension-Free Sub-Urethral Sling (Tot) in The Treatment of Female Urinary Incontinence

Eutimio N. Gustavo, Claudia F. Roberto, Salgado A., Diamantina

ABSTRACT

Considering the good results added to the experience acquired in the use of a tension-free synthetic sling through the retropubic route and the encouraging reports published from the experience of Delorme in France, referring to the placement of the sling through the transobturator orifice For the treatment of female urinary incontinence, we developed this technique with some modifications and used it in a group of 20 patients who consulted for urinary incontinence at Clínica Dávila between November 2022 and August 2023. There were no complications in this group, all patients remain continent during the follow-up period and express satisfaction with the results.

Keywords: *Transobturator (TOT) ; urinary incontinence*
